

Machine Configuration Standards

JumpCloud Deployment

- JumpCloud will be deployed on all company machines to provide centralized user management, directory services, and device policies.
- The IT department will ensure that each machine is enrolled in JumpCloud and assigned to the appropriate user based on their role and responsibilities.
- JumpCloud will be configured to enforce strong password policies to enhance security.

Bitdefender Deployment

- Bitdefender Endpoint Protection will be installed on all company machines to provide real-time threat detection and protection against malware and viruses.
- The IT department will regularly update and maintain the Bitdefender software to ensure the latest security definitions and patches are applied.

Automatic Session Locking

- All company machines will be configured to enable automatic session locking after a period of inactivity(no more than 15 minutes) to prevent unauthorized access.

Software Updates and Patches

- Operating systems and software applications on company machines will be set to receive automatic updates and patches.
- Updates will be enforced on devices after a specified number of days to ensure timely patching and minimize security risks.
 - Update Policies:
 - Vanguard: 0-3 days after release
 - Early Adopter: 3-7 days after release
 - General Public: 7-14 days after release
 - Late Adopter: 14-30 days after release
- The IT department will conduct regular reviews and tests to ensure that automatic updates do not cause any compatibility or performance issues.

Data Encryption

- All company machines will be configured with full-disk encryption to protect sensitive data in case of loss or theft.
- The IT department will manage encryption keys securely and ensure that access to encrypted data is only granted to authorized users.

User Privileges

- User accounts on company machines will be provisioned with the principle of least privilege, granting access only to the resources necessary for their job roles.
- The IT department will regularly review and update user privileges to align with changing responsibilities.

Device Decommissioning

- When a machine is retired or no longer in use, the IT department will ensure that all data is securely wiped from the device.
- The decommissioning process will include removing the machine from JumpCloud and other centralized management systems.
